

Industrial Central Vacuum Systems

- ❖ **Written emissions guarantees**
- ❖ **Wide variety of filter media**
- ❖ **Analyze of your particular requirements**
- ❖ **Efficiently sized tubing system**
- ❖ **Optimal hose, tool and attachment selections**

Mac Process understands that every application has unique factors, and that our ability to recognize the best solution will determine which technology we recommend:

The Vacuum Source:

- Multi-stage centrifugal exhausters (multi-user applications)
- Positive displacement pumps (bulk spill clean-up)
- Regenerative exhausters (smaller single-user situations)

Providing a vacuum source is only part of the solution. The best exhauster available might be rendered useless if not paired with the best separator solution, and nobody offers more than Mac Process.

The Separator:

- Hopper-bottom or bin-vent style
- Custom-designed support frames
- Bag or cartridge filters
- Horizontal or vertical filter orientation
- Clean or dirty side filter exchange
- Tangential, radial and rock-box inlets

Mac Process will evaluate your process and provide a cleaning solution that will address all your needs. Complete turn-key solutions are available that can include engineering, custom fabrication, installation and preventative maintenance.

System Design:

- Industrial process experience second to none.
- The ability to analyze your particular requirements.
- Wide variety of filter media, discharge & disposal methods, and filter cleaning systems.
- Written emissions guarantees.
- An efficiently sized tubing system with the optimal hose, tool and attachment selections.
