

## **Exciting New Era for MAC Equipment**

*Kansas City, MO – June 2008*

MAC Equipment, one of North America's leading providers of pneumatic conveying and air filtration solutions, has entered an exciting new phase in its development.

Last year, MAC Equipment was acquired by Clyde Process Solutions plc, a UK-listed company who also own and operate Clyde Materials Handling, a leading provider of pneumatic conveying and pneumatic injection solutions targeted predominately at the metals and minerals markets. Clyde Process Solutions acquired MAC Equipment in April 2007 and has now integrated the conveying and injection technologies of Clyde Materials Handling with MAC Equipment to establish a powerful provider of process technologies for the North American market.

In an effort to strengthen MAC's position as a market leading provider of process solutions, they have made the decision to enhance their brand and identity. The new MAC Equipment brand retains the characteristics that have helped build their business in the process industry, while incorporating the brand assets inherited from its parent company, Clyde Process Solutions.

MAC Equipment's new brand was launched at the PTXi Show in Chicago last month, which was warmly received by all. Through the integration of Clyde Materials Handling's US operations with MAC Equipment, MAC can now offer the process industry a wide range of material handling and air filtration solutions, which encompass:

- Dense Phase pneumatic conveying for high tonnage, low velocity transportation of difficult, arduous raw materials
- Pneumatic Injection for high accuracy, highly reliable injection of materials direct to process
- Spheri Valve for low maintenance, highly durable control of material flow

These new technologies will complement MAC Equipment's existing range of market-leading pneumatic conveying and air filtration solutions, which include:

- Continuous Dense Phase conveying offering true continuous feed, reduced air consumption requirements and dramatically reduced product degradation
- Low Pressure Continuous Dense Phase conveying for gentle handling of fragile food products
- Dilute phase conveying systems, also know as suspension flow, accomplished by metering product into a moving air stream
- Central Vacuum Systems for industrial cleaning needs
- Medium Pressure Controlled Cleaning for the most energy efficient air filtration
- Pulse Jet Dust Filters for tough industrial applications
- Custom built Cyclones, dust filters, cartridge collectors with a variety of filter media
- Real World Lab Testing prior to final system selection to ensure the desired results can be achieved

The union of MAC Equipment and Clyde Materials Handling has created a process solutions provider who is focused on improving the efficiency and productivity of their key customer markets and who is committed to setting the industry standard for innovation, product quality and customer service.
